### **Tankless Water Heaters**

Tankless water heaters provide hot water when needed without a storage tank, which reduces stand-by heat loss and in turn saves money. Tankless water heaters have an electric, natural gas, or propane heating device that is activated by the flow of water. Once activated, the heater provides a constant supply of hot water. An advantage of tankless water heaters is they provide unlimited hot water when sized correctly. Because there's no tank, they heat water on the fly providing all the water a homeowner needs. Tankless water heaters are not just for new home construction; they can also be used for remodeling, renovations and additions. Tankless water heaters provide distinct advantages in remodeling. For example, by adding a small unit in the addition, you save plumbing costs by avoiding the need for new plumbing lines to be run from the existing whole house unit or the need for replacing the whole house unit in favor of a larger unit to accommodate the additional needs.
